**Amendments to the Claims:**

This listing of claims will replace all prior versions and listings of claims in the application:

**Listing of Claims:**

1. (Cancelled)
2. (Previously Presented) The method of Claim 3, wherein the found at least one peak comprises the highest peak within the window.
3. (Previously Presented) A method for softlimiting a signal that is a composite signal comprising more than one carrier frequency, comprising:
  - searching for at least one peak above a threshold within a first window created from a set of samples of the signal;
  - adding a threshold-correcting signal to at least one peak found by the step of searching for at least one peak; and
  - examining the composite signal after adding the threshold-correcting signal to the found highest peak to determine if at least one unwanted oscillation has been introduced into the composite signal by the threshold-correcting signal.

67.108-133  
Kim 13-4

4. (Currently Amended) The method of Claim 3, wherein the step of examining the composite signal comprises:

searching for at least one other peak within the first window of samples; and

adding another threshold correcting signal to at least one other peak found by the step of searching for the at least ~~another~~ one other peak.

5. (Previously Presented) The method of Claim 3, comprising:

continuing to search for additional peaks within the first window, correspondingly adding threshold correcting signals for each additional found peak and examining the composite signal until the samples within the first window are below the threshold.

6. (Previously Presented) The method of Claim 3, comprising:

searching for at least one additional highest peak above the threshold within a second window created from the set of samples created;

adding an additional threshold correcting signal to the at least one additional highest peak found by the step of searching for at least one additional highest peak; and

examining the composite signal again after adding the additional threshold correcting signal to the at least one additional found highest peak to determine if at least another additional found peak within the second window has been reduced below the threshold and/or at least one unwanted oscillation has not been introduced into the composite signal by the additional threshold correcting signal.

67,108-133  
Kim 13-4

7. (Previously Presented) The method of Claim 6, wherein the step of examining the composite signal again after adding the additional threshold-correcting signal comprises:

if the at least another additional peak has not been reduced below the threshold and/or the at least one unwanted oscillation has been introduced into the composite signal by the additional threshold correcting signal,

searching for the at least another additional peak within the second window of samples; and

adding another additional threshold correcting signal to the at least another additional peak found by the step of searching for the at least another additional peak.

8. (Currently Amended) The method of Claim 7, ~~further~~ comprising:

continuing to search for more additional peaks within the second window, correspondingly adding threshold-correcting signals for each of the more additional peaks found and examining the composite signal until the samples within the second window are below the threshold.

9. (Cancelled)

Kim 13-4

10. (Previously Presented) The system of Claim 13, wherein the signal is a composite signal comprising more than one carrier frequency, and further comprising:

a delay device for time aligning the threshold compensating signal relative to the detected highest peak; and

a summing device for summing the threshold-compensating signal with the composite signal.

11. (Previously Presented) The system of Claim 13, wherein the peak compensating device comprises:

a clipping factor calculator for calculating a magnitude and a polarity of the threshold compensating signal for the clipping filter; and

a multiplier for multiplying the detected highest peak with the calculated magnitude and polarity.

67,108-133  
Kim 13-4

12. (Previously Presented) A system comprising:
- an amplifier for amplifying a signal; and
  - a peak compensating device comprising:
    - a peak search detector for detecting the presence of at least a highest peak above a threshold within a window of samples; and
    - a clipping filter for generating a threshold-compensating signal in response to detecting the presence of at least a highest peak wherein the clipping filter comprises at least one carrier filter for obtaining a sum of finite impulse responses for each carrier frequency of the composite signal.
13. (Previously Presented) A system comprising:
- an amplifier for amplifying a signal; and
  - a peak compensating device comprising:
    - a peak search detector for detecting the presence of at least a highest peak above a threshold within a window of samples; and
    - a clipping filter for generating a threshold-compensating signal in response to detecting the presence of at least a highest peak wherein the clipping filter comprises one carrier filter for each carrier frequency of the composite signal, at least one of the carrier filters being weighted differently than the remaining carrier filters to control the in-band correction signal power.

67,108-133  
Kim 13-4

14. (Previously Presented) The system of Claim 13, wherein the weighting of the at least one carrier filter for the different carriers causes the in-band correction signal power to be distinct for each carrier frequency.

15. (Cancelled)

16. (Currently Amended) A method for clipping peaks of a composite signal, the method comprising:

searching for a first highest peak above a threshold within a first window created from a set of samples of the signal;

calculating a magnitude and polarity of a threshold-correcting signal for the first highest peak;

examining the characteristics of the composite signal if the threshold correcting signal is added to the first highest peak; and

selectively adding the threshold-correcting signal with the first window of samples at the position of the first highest peak found by the step of searching for a first highest peak depending on a result of the examining.

67,108-133  
Kim 13-4

17. (Original) The method of Claim 16, wherein the step of adding the threshold correcting signal is performed if at least one of the following are determined by the step of examining the characteristics of the composite signal:

another peak within the window has been reduced below the threshold; and

at least one unwanted oscillation has not been introduced into the composite signal by the threshold-correcting signal.

18. (Currently Amended) The method of Claim 17, ~~further~~ comprising:

searching for a second highest peak above the threshold within a second window created from the set of samples;

calculating a second magnitude and a second polarity of the second threshold-correcting signal for the second highest peak;

examining the characteristics of the composite signal if the second threshold correcting signal is added to the second highest peak found within the second window; and

adding the second threshold correcting signal to the second highest peak found by the step of searching for a second highest peak within the second window; and

examining the composite signal again after adding the second threshold-correcting signal to the second highest peak.

67,108-133  
Kim 13-4

19. (Currently Amended) The method of Claim 18, wherein the step of examining the composite signal again after adding the second threshold-correcting signal comprises:

if at least another additional found peak within the second window has not been reduced below the threshold and/or at least one unwanted oscillation has been introduced into the composite signal by the second threshold correcting signal,

searching for the at least another peak within the second window of samples created; and

adding another threshold correcting signal to the at least another additional peak found by the step of searching for the at least another additional peak.

20. (Currently Amended) The method of Claim 19, ~~further~~ comprising:

continuing to search for more peaks within the at least one of the first and the second windows, correspondingly adding more threshold correcting signals for each of the more peaks found and examining the composite signal until the samples within the at least one of the first and the second windows are below the threshold.

21. (New) The method of Claim 3, comprising:

determining a location of the at least one peak; and

adding the threshold-correcting signal at the determined location of the at least one peak.

67.108-133  
Kim 13-4

22. (New) The method of Claim 21, comprising:  
delaying the signal an amount corresponding to a time associated with creating the threshold-correcting signal.
23. (New) The method of Claim 16, comprising:  
determining a location of the highest peak; and  
adding the threshold-correcting signal at the determined location of the at least one peak.
24. (New) The method of Claim 23, comprising:  
delaying the signal an amount corresponding to a time associated with creating the threshold-correcting signal.
